APPENDIX A-1
EXECUTIVE SUMMARY

The County publishes annual community greenhouse gas (GHG) emissions estimates through the Marin Climate & Energy Partnership (MCEP). Annual inventories help the County to monitor its progress in meeting its Climate Action Plan (CAP) goal to reduce community emissions 40% below the 1990 level by 2030 through mitigation measures. The County’s CAP goal also establishes targets for reducing emissions 60% below the 2005 level by 2030 through mitigation and sequestration measures. Ultimately, the County’s goal is to achieve carbon neutrality by 2045.

This report reviews emissions generated from the unincorporated Marin area ("the County") from 2005 through 2020, the most recent year data is available. The inventory shows that the County has reduced emissions 23% since 2005, which is equivalent to 10% below estimated 1990 levels. Emissions dropped from about 503,952 metric tons carbon dioxide equivalents (MTCO2e) in 2005 to 386,344 MTCO2e in 20120. The community emissions trend and targets are shown below. The County needs to reduce emissions another 129,330 MTCO2e to meet its 2030 mitigation target and another 300,670 MTCO2e to meet the State mitigation target for 2050, which is 80% below 1990 levels.

Recognizing the need for a collaborative approach to greenhouse gas reductions, town, city, and county leaders launched the Marin Climate and Energy Partnership (MCEP) in 2007. The County of Marin is a member of MCEP and works with representatives from the Marin cities and towns to address and streamline the implementation of a variety of greenhouse gas reduction measures. Funding for this inventory was provided by the Marin County Energy Watch Partnership, which administers public goods charges collected by PG&E. Community inventories are available on the MCEP website at marinclimate.org and are used to update the Marin Sustainability Tracker.
INTRODUCTION

PURPOSE OF INVENTORY
The objective of this greenhouse gas emissions inventory is to identify the sources and quantify the amounts of greenhouse gas emissions generated by the activities of the unincorporated Marin communities in 2020. This inventory provides a comparison to 2005 emissions and estimated 1990 emissions and identifies the sectors where significant reductions in greenhouse gas emissions have occurred. In some instances, previous year emissions were updated with new data and/or recalculated to ensure the same methodology was employed for all inventory years.

GENERAL METHODOLOGY
This inventory uses national standards for the accounting and reporting of greenhouse gas emissions. The U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions, version 1.2 (July 2019) was used for the quantification and reporting of community emissions. Quantification methodologies, emission factors, and activity and source data are detailed in the appendix.

Community emissions are categorized according to eight sectors:

- Built Environment - Electricity
- Built Environment – Natural Gas
- Transportation
- Off-Road Vehicles and Equipment
- Waste
- Water
- Wastewater
- Agriculture

CALCULATING EMISSIONS
Emissions are quantified by multiplying the measurable activity data – e.g., kilowatt hours of electricity, therms of natural gas, and gallons of diesel or gasoline – by emissions factors specific to the energy source. Most emissions factors are the same from year to year. Emission factors for electricity, however, change from year to year due to the specific sources that are used to produce electricity. For example, electricity that is produced from coal generates more greenhouse gases than electricity that is generated from natural gas and therefore has a higher emissions factor. Electricity that is produced solely from renewable energy sources such as solar and wind has an emissions factor of zero.

This inventory calculates individual greenhouse gases – e.g., carbon dioxide, methane and nitrous oxide – and converts each greenhouse gas emission to a standard metric, known as “carbon dioxide equivalents” or CO₂e, to provide an apple-to-apples comparison among the various emissions. Table 1 shows the greenhouse gases identified in this inventory and their global warming potential (GWP), a measure of the amount of warming each gas causes when compared to a similar amount of carbon dioxide. Methane, for example, is 28 times as potent as carbon dioxide over 100 years; therefore, one metric ton of methane is equivalent to 28 metric tons of carbon dioxide. Greenhouse gas emissions are reported in this inventory as metric tons of carbon dioxide equivalents, or MTCO₂e.

### TYPES OF EMISSIONS

Emissions from each of the greenhouse gases can come in a number of forms:

- **Stationary or mobile combustion** resulting from the on-site combustion of fuels (natural gas, diesel, gasoline, etc.) to generate heat or electricity, or to power vehicles and equipment.
- **Purchased electricity** resulting from the generation of power from utilities outside the jurisdictional boundary.
- **Fugitive emissions** resulting from the unintentional release of greenhouse gases into the atmosphere, such as leaked refrigerants and methane from waste decomposition.
- **Process emissions** from physical or chemical processing of a material, such as wastewater treatment.

### UNDERSTANDING TOTALS

The totals listed in the tables and discussed in the report are a summation of emissions using available estimation methods. Each inventoried sector may have additional emissions sources associated with them that were unaccounted for due to a lack of data or robust quantification methods. For example, greenhouse gas emissions associated with air travel and the production of goods outside the community’s boundary are not included in the inventory. Additionally, the community inventory does not include refrigerants released into the atmosphere from the use of air conditioning in cars and buildings.
COMMUNITY INVENTORY

COMMUNITY INVENTORY SUMMARY

In 2005, the activities taking place in unincorporated Marin County resulted in approximately 503,952 metric tons of CO₂e. In 2020, those activities resulted in approximately 386,344 metric tons of CO₂e, a reduction of 23% from 2005 levels, which is equivalent to 10% below estimated 1990 levels.

The community inventory tracks emissions in seven sectors:

- **The Built Environment – Electricity** sector represents emissions generated from the use of electricity in unincorporated Marin homes and commercial, industrial, and governmental buildings and facilities.
- **The Built Environment – Natural Gas** sector represents emissions generated from the use of natural gas in unincorporated Marin homes and commercial, industrial, and governmental buildings and facilities. Propane used as a primary heating source is also included, although it represents less than 1% of emissions in this sector.
- **The Transportation** sector includes tailpipe emissions from passenger vehicle trips originating and ending in unincorporated Marin areas, as well as a share of tailpipe emissions generated by medium and heavy-duty vehicles and buses travelling on Marin County roads. The sector also includes emissions from Marin Transit and Golden Gate Transit buses and the SMART train as these vehicles travel within the unincorporated area. Electricity used to power electric vehicles is embedded in electricity consumption reported in the Built Environment - Electricity sectors.
- **The Waste** sector represents fugitive methane emissions that are generated over time as organic material decomposes in the landfill. Although most methane is captured or flared off at the landfill, approximately 25% escapes into the atmosphere.
- **The Off-Road** sector represents emissions from the combustion of gasoline and diesel fuel from the operation of off-road vehicles and equipment used for construction and landscape maintenance.
- **The Water** sector represents emissions from energy used to pump, treat, and convey potable water from the water source to unincorporated Marin water users.
- **The Wastewater** sector represents stationary, process and fugitive greenhouse gases that are created during the treatment of wastewater generated by the community, as well as emissions created from electricity used to convey and treat wastewater.
- **The Agriculture** sector includes methane emissions from enteric fermentation and manure decomposition and treatment, and nitrogen oxide emissions from fertilizer application.

Table 2 shows how emissions in each sector have changed since 2005. The greatest reductions have occurred in the Built Environment - Electricity sector (–66,942 MTCO₂e), followed by the Transportation sector (–23,927 MTCO₂e) and the Built Environment – Natural Gas sector (16,490 MTCO₂e). The likely reasons for the largest emissions decreases are described in the remainder of this report. Figure 2 shows the relative contribution of emissions from these sectors in 2020. Agriculture is the largest sector, representing 34% of community emissions.

### FIGURE 2: EMISSIONS BY SECTOR, 2020

![Chart showing emissions by sector in 2020]
**PER CAPITA EMISSIONS**

Per capita emissions can be a useful metric for measuring progress in reducing greenhouse gases and for comparing one community’s emissions with neighboring cities and against regional and national averages. That said, due to differences in emission inventory methods, it can be difficult to produce directly comparable per capita emissions numbers. Per capita emission rates may be compared among Marin jurisdictions, although some jurisdictions may have higher rates due to the presence of commercial and industrial uses.

Dividing the total communitywide GHG emissions by residents yields a result of 7.5 metric tons CO₂e per capita in 2005. Per capita emissions decreased 26% between 2005 and 2020, falling to 5.6 metric tons per person. Figure 3 shows the trend in per capita emissions over time. It is important to understand that this number is not the same as the carbon footprint of the average individual living in Marin, which would include lifecycle emissions, emissions resulting from air travel, etc.

**FIGURE 3: EMISSIONS PER CAPITA**

![Graph showing per capita emissions over time]

**SECTOR SPOTLIGHTS**

The following sections provide a year-by-year analysis of the changes in GHG emissions from some highlighted sectors: electricity, natural gas, transportation, waste, water use, and agriculture. Whenever possible, each section discusses the change in emissions from previous years and the likely influence of state and local programs or policies and external factors on reducing emissions.

**BUILT ENVIRONMENT - ELECTRICITY**

Purchased electricity use in homes and businesses in unincorporated Marin decreased about 16% between 2005 and 2020. Greenhouse gas emissions from electricity consumption decreased 82% since 2005, as shown in Figure 4. This is primarily due to the lower carbon intensity of electricity. PG&E has been steadily increasing the amount of renewable energy in its electricity mix. In 2020, PG&E electricity came from a mix of renewable (31%), large hydroelectric (10%), nuclear (43%), and natural gas (16%) energy sources and was 84% GHG-free.¹ MCE Light Green

electricity came primarily from renewable (61%) and hydroelectric (36%) sources and was 98% GHG-free. In 2020, about 15.1% of MCE electricity purchased by unincorporated Marin customers was 100% renewable Deep Green electricity. The County also purchases Deep Green for its government operations.

FIGURE 4: ELECTRICITY CONSUMPTION AND EMISSIONS

Built Environment - Natural Gas

Natural gas is used in residential and commercial buildings to provide space and water heating and power appliances. Use of natural gas is highly variable typically depending on the weather conditions. This variability has led natural gas use consumption in unincorporated Marin to fluctuate from year to year, from a high of 20.0 million therms in 2005 to a low of 15.3 million therms in 2014. Reduction in energy use may also be attributed to energy efficiency programs and rebates, the County’s green building ordinances, and State building codes. Natural gas consumption declined 1% between 2019 and 2020 and was 14% below the 2005 level in 2020. Unlike electricity emissions which reflect the power content mix, natural gas emissions track the amount of natural gas consumed (Figure 5).

FIGURE 5: NATURAL GAS CONSUMPTION AND EMISSIONS

---

2 MCE 2020 Power Content Label, https://www.mcecleanenergy.org/energy-suppliers/#ilightbox47d9eefc46030b57d7a1/0.
TRANSPORTATION

Transportation activities accounted for approximately 31% of unincorporated Marin’s emissions in 2020. According to the transportation model and annual data the County uses to calculate passenger and commercial vehicle miles, vehicle miles traveled (VMT) have increased approximately 1% since 2005 and decreased 1% between 2019 and 2020. However, this data may not accurately reflect recent trends. The transportation model has not been updated for several years (it is currently being revised), and the annual data the County uses to adjust the model’s output provides vehicle counts on state highways but not local roads, where the pandemic most likely reduced VMT.

On-road transportation emissions decreased 17% due to more fuel-efficient and alternatively fueled vehicles (Figure 6). As shown in Figure 7, most transportation emissions come from passenger vehicles, accounting for 85% of transportation emissions in 2020. Marin County continues to be a leader in zero emission vehicles (ZEVs) – second only to Santa Clara County – with 9,709 ZEVs in Marin at the end of 2020, or about 4.7% of registered automobiles. ZEVs include battery electric cars, plug-in hybrid electric cars, hydrogen fuel cell cars, and zero-emission motorcycles.

FIGURE 6: VEHICLE MILES TRAVELED AND TRANSPORTATION EMISSIONS

![Figure 6: Vehicle Miles Traveled and Transportation Emissions](image)

FIGURE 7: TRANSPORTATION EMISSIONS BY VEHICLE CATEGORY, 2020

![Figure 7: Transportation Emissions by Vehicle Category, 2020](image)
While it is difficult to pinpoint exactly how each land use and transportation policy affects emissions, the County has undertaken many efforts to reduce transportation emissions. The County encourages workforce housing and has made it easier for residents to use carbon-free modes of transportation, such as bicycling and walking, through improvements to the transportation network.

**Waste**

Waste generated by the community hit a low in 2011, increased for the next six years, and has recently started to decline again as shown in Figure 8 (based on countywide disposal data). Total landfilled waste (including alternative daily cover) decreased 15% between 2019 and 2020 and was 23% below 2005 levels in 2020. Emissions from waste disposal decreased 37% primarily due to the lower organic content landfilled waste and material used for alternative daily cover.

**FIGURE 8: DISPOSED WASTE AND EMISSIONS**

![Figure 8: Disposed Waste and Emissions](chart.png)

**Water**

The Marin Municipal Water District (MMWD) and the North Marin Water District (NMWD) serve most of the water customers in unincorporated Marin. Water consumption increased 7% between 2019 and 2020 and was 17% below the 2005 level in 2020. Emissions, which are based on an estimate of energy used to pump, treat, and convey water from the water source to the water users, dropped 96% between 2005 and 2020 (Figure 9). The additional reduction is due to the lower carbon intensity of electricity. Both MMWD and NMWD purchase MCE Deep Green for their electricity needs, and the Sonoma County Water Agency (SCWA), which supplied approximately 27% of MMWD’s water and 80% of NMWD’s water in 2020, uses renewable and carbon-free sources for its electricity needs; a small amount of emissions comes from stationary and mobile combustion of fuels used in SCWA’s operations.

---

3 Alternative daily cover is cover material other than earthen material placed on the surface of the active face of a municipal solid waste landfill at the end of each operating day to control vectors, fires, odors, blowing litter, and scavenging.
MMWD and NMWD provide rebates and programs to reduce water use. MMWD provides rebates to replace fixtures with high-efficiency clothes washers and to purchase cisterns and rain barrels. MMWD also provides free home and landscape water-use evaluations as well as free high-efficiency showerheads and faucet aerators.

NMWD provides rebates to replace fixtures with high-efficiency toilets and clothes washers, and to purchase pool covers, hot water recirculating systems, water-efficient landscapes, graywater systems, and rain barrels. NMWD provides free home and landscape water-use evaluations.

**AGRICULTURE**

Of all the local CAPs in Marin, the unincorporated County’s is the only one to include emissions from agriculture. This sector includes GHG emissions from manure management (fugitive emissions of methane and nitrous oxide), enteric fermentation (fugitive emissions of methane and nitrous oxide), and fertilizer use (fugitive emissions of nitrous oxide). Agricultural emissions have increased 3% since 2005. (Figure 10). Emissions from enteric fermentation and the management of manure make up the biggest share and hence drive agricultural emissions. Emissions reductions from carbon sequestration, which are quantified in the CAP, are not balanced against agricultural emissions here.

Certain agricultural variables, such as composition of feed for cattle or chickens, can significantly alter livestock emissions factors. Detailed data on how feed proportions have changed since 2012 was not collected for the GHG assessment. As a proxy, emission factors used in the 2012 inventory are assumed are used for all inventory years. As a result, emissions are dependent upon livestock counts and acreage under agricultural production. Livestock counts, in particular, can vary significantly from year to year, and some are estimated due to privacy concerns.

**Legend**

IE – Included Elsewhere: Emissions for this activity are estimated and presented in another category of the inventory. The category where these emissions are included should be noted in the explanation.
NE – Not Estimated: Emissions occur but have not been estimate or reported (e.g., data unavailable, effort required not justifiable).
NA – Not Applicable: The activity occurs but does not cause emissions; explanation should be provided.
NO – Not Occurring: The source or activity does not occur or exist within the community.
## Community Emissions Data Sources and Calculation Methodologies
